

Lunar ROADSTER

(Robotic Operator for Autonomous Development of
Surface Trails and Exploration Routes)

“Starting with a foothold on the Moon, we pave the way to the cosmos”

The Team

Ankit Aggarwal

Deepam Ameria

Bhaswanth Ayapilla

Simson D'Souza

Boxiang (William) Fu

Dr. William "Red" Whittaker

Goal: Resolve Arduino connection & reset issue

In Progress:

- Implementing a software-based auto-reset feature
- Using GPIO Pins on Jetson and Digital Pins on Arduino

Software Procedure:

- Arduino (micro-ROS): Publishes /arduino_heartbeat
- Jetson (ROS 2 C++ node):
 - Subscribes to /arduino_heartbeat
 - On timeout (> 5 s): toggle GPIO via **libgpiod**
 - Pulse ~200 ms → reset Arduino

Goal: Implement new total station resection method

Resection: Uses three or more known reference points to solve both position and orientation of the total station (more accurate)

Key Motivation: Swapping batteries will not lead to total station offsets anymore

Validation: A fixed target measured from different total station setups yields consistent coordinates

Goal: Finalize validation stack code methodology

- Step 1:** Obtain point cloud from ZED camera FOV
- Step 2:** Use RANSAC to fit a plane
- Step 3:** Discretize map into grids and bin points in each cell
- Step 4:** Compute an elevation map relative to the RANSAC plane
- Step 5:** Compute gradients using finite differences
- Step 6:** Remove excessive gradients (walls)
- Step 7:** Compute maximum gradient

Goal: Finalize validation stack code methodology (PERCEPTION)

- **Device Used:** ZED 2i RGBD Stereo Camera
- **Methodology:** Train a Deep Learning Model (YOLO) on a custom Crater dataset to determine geometric data: centroid, diameter, distance to crater, etc.
- **Data collection** using ZED 2i and annotation to be done manually
- **Output:** Crater dimensions and position in robot frame which will be used by the planning stack to get robot poses

Goal: Finalize global path planner methodology

Inputs:

- Occupancy grid with crater classification
- Reference circular path (ring)
- Obstacles are large sized craters ($>0.5\text{m}$)
- Costmap with Ring Bias: adds extra cost for leaving the ring corridor

Planner:

- Hybrid-A* (lattice) search with Ackermann primitives
- Forward-only Dubins arcs (for minimum turn radius)
- g-cost: arc length + curvature penalty + obstacle cost + deviation from ring
- Heuristic: Dubins distance to goal + small penalty for ring misalignment

Directionality:

- Only Counter Clockwise motion
- Reverse moves allowed but heavily penalized

Outputs:

- Collision-free, curvature-feasible path hugging the latitude
- Path naturally passes through crater centers on the ring
- Smooth detours around large craters, rejoining the ring

Goal: Finalize global navigation controller methodology

Pure Pursuit Controller Workflow

1. Receive **global path** (list of waypoints)
2. Get **current robot pose** from localization
3. Select **lookahead point** at distance L along path
4. **Transform** lookahead point to robot frame
5. Compute **curvature and steering angle**
6. Send **steering & velocity commands** to actuators
7. **Repeat steps 2 - 6** until goal is reached

Goal: Finish implementing selection of gradable craters from global map generated from FARO scanner

Global Cost Map

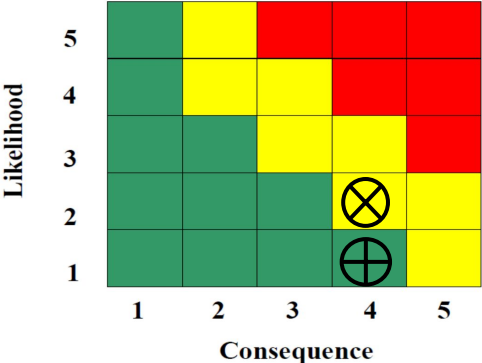

Identified gradable craters based on diameter and depth, extracting their coordinates which will be used for navigation

```
Centroids of Gradable Craters (World Coordinates):  
Crater 1: X = 10.298 m, Y = 3.360 m  
Crater 2: X = 7.726 m, Y = 4.857 m  
Crater 3: X = 11.359 m, Y = 5.070 m  
Crater 4: X = 9.526 m, Y = 6.944 m
```

		4/10/2025																																						
Consequence																																								
Slows down setup time and impacts operational readiness, delaying mission start and mode transitions.																																								
Action/Milestone		Success Criteria	Date Planned	Date Implemented																																				
Check USB port permissions and drivers issues on Jetson		Successfully establish consistent serial connection without reset	4/26/2025	9/5/2025																																				
Verify that Arduino is connected via USB 3.0 instead of USB 2.0 port		Ensure stable high-speed communication	4/26/2025	9/5/2025																																				
Check for ROS node frequency mismatches causing packet loss to Arduino		Match ROS publish/subscribe rates	4/26/2025	9/5/2025																																				
Implement a software reset trigger		Reset can be called from the operations terminal	9/7/2025																																					

Issues Log

I12	08/29/2025	09/12/2025	Bhaswanth Ayapilla	Localization frame shift after total station battery swap	1. Implement resection method using three known prism locations instead of orientate-to-line 2. Explore and test alternative localization methods (using SkyCam)	Learned and implemented resection method for localization using total station	Quick solution to implement first before exploring alternatives
I13	09/08/2025	09/14/2025	Team	Compute unit (Orin & Jetson) unable to communicate with Arduino	1. Replace old Arduino with new one 2. Find code workarounds to force communication 3. Retrace wiring to make sure everything is wired correctly	MicroROS versions between Orin and Arduino were incompatible. Reinstalled MicroROS resolved the problem	This allows Orin to communicate with the Arduino, which is used to send motor commands
I14	09/14/2025		Team	Steer pinion tooth chipped and worn-out due to wear-and-tear. Unable to find exact replacement for the pinion	1. Replace with similar pinion that has different tooth count 2. Switch to using another chassis		
I15	09/14/2025		Ankit Aggarwal Deepam Ameria Simson D'Souza	Wires keep on coming loose during operations due to bad soldering	1. Re-solder every wire 2. Switch to plug connectors and buy adaptors for the RoboClaws and motors		

Future Work

- Tuned validation stack - perception and verification separately
- Local navigation controller ready
- Navigation stack tested and tuned
- Methodology for integration
- Hardware finalized

THANKS!

Team Lunar ROADSTER
